

# NAG C Library Function Document

## nag\_mesh2d\_join (d06dbc)

### 1 Purpose

nag\_mesh2d\_join (d06dbc) joins together (restitches) two adjacent, or overlapping, meshes.

### 2 Specification

```
void nag_mesh2d_join (double eps, Integer nv1, Integer nelt1, Integer nedge1,
                      const double coor1[], const Integer edge1[], const Integer conn1[],
                      const Integer reft1[], Integer nv2, Integer nelt2, Integer nedge2,
                      const double coor2[], const Integer edge2[], const Integer conn2[],
                      const Integer reft2[], Integer *nv3, Integer *nelt3, Integer *nedge3,
                      double coor3[], Integer edge3[], Integer conn3[], Integer reft3[],
                      Integer itrace, const char *outfile, NagError *fail)
```

### 3 Description

nag\_mesh2d\_join (d06dbc) joins together two adjacent, or overlapping, meshes. If the two meshes are adjacent then vertices belonging to the part of the boundary forming the common interface should coincide. If the two meshes overlap then vertices and triangles in the overlapping zone should coincide too.

This function is partly derived from material in the MODULEF package from INRIA (Institut National de Recherche en Informatique et Automatique).

### 4 References

None.

### 5 Parameters

- |   |                         |              |
|---|-------------------------|--------------|
| 1:  | <b>eps</b> – double     | <i>Input</i> |
| <i>On entry:</i> the relative precision of the restitching of the two input meshes (see Section 8). |                         |              |
| <i>Suggested value:</i> 0.001.  |                         |              |
| <i>Constraint:</i> <b>eps</b> > 0.0.  |                         |              |
| 2:  | <b>nv1</b> – Integer    | <i>Input</i> |
| <i>On entry:</i> the total number of vertices in the first input mesh.                              |                         |              |
| <i>Constraint:</i> <b>nv1</b> $\geq 3$ .  |                         |              |
| 3:  | <b>nelt1</b> – Integer  | <i>Input</i> |
| <i>On entry:</i> the number of triangular elements in the first input mesh.                         |                         |              |
| <i>Constraint:</i> <b>nelt1</b> $\leq 2 \times \mathbf{nv1} - 1$ .                                  |                         |              |
| 4:  | <b>nedge1</b> – Integer | <i>Input</i> |
| <i>On entry:</i> the number of boundary edges in the first input mesh.                              |                         |              |
| <i>Constraint:</i> <b>nedge1</b> $\geq 1$ .   |                         |              |

5: **coor1**[ $2 \times \mathbf{nv1}$ ] – const double *Input*

**Note:** where **COOR1**( $i, j$ ) appears in this document it refers to the array element **coor1**[ $2 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

*On entry:* **COOR1**( $1, i$ ) contains the  $x$ -coordinate of the  $i$ th vertex of the first input mesh, for  $i = 1, \dots, \mathbf{nv1}$ ; while **COOR1**( $2, i$ ) contains the corresponding  $y$ -coordinate.

6: **edge1**[ $3 \times \mathbf{nedge1}$ ] – const Integer *Input*

**Note:** where **EDGE1**( $i, j$ ) appears in this document it refers to the array element **edge1**[ $3 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

*On entry:* the specification of the boundary edges of the first input mesh. **EDGE1**( $1, j$ ) and **EDGE1**( $2, j$ ) contain the vertex numbers of the two end-points of the  $j$ th boundary edge. **EDGE1**( $3, j$ ) is a user-supplied tag for the  $j$ th boundary edge.

*Constraint:*  $1 \leq \mathbf{EDGE1}(i, j) \leq \mathbf{nv1}$  and **EDGE1**( $1, j$ )  $\neq$  **EDGE1**( $2, j$ ) for  $i = 1, 2$  and  $j = 1, 2, \dots, \mathbf{nedge1}$ .

7: **conn1**[ $3 \times \mathbf{nelt1}$ ] – const Integer *Input*

**Note:** where **CONN1**( $i, j$ ) appears in this document it refers to the array element **conn1**[ $3 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

*On entry:* the connectivity between triangles and vertices of the first input mesh. For each triangle  $j$ , **CONN1**( $i, j$ ) gives the indices of its three vertices (in anticlockwise order), for  $i = 1, 2, 3$  and  $j = 1, \dots, \mathbf{nelt1}$ .

*Constraints:*

$1 \leq \mathbf{CONN1}(i, j) \leq \mathbf{nv1}$ ;  
**CONN1**( $1, j$ )  $\neq$  **CONN1**( $2, j$ );  
**CONN1**( $1, j$ )  $\neq$  **CONN1**( $3, j$ ) and **CONN1**( $2, j$ )  $\neq$  **CONN1**( $3, j$ ) for  $i = 1, 2, 3$  and  $j = 1, 2, \dots, \mathbf{nelt1}$ .

8: **reft1**[ $\mathbf{nelt1}$ ] – const Integer *Input*

*On entry:* **reft1**[ $k - 1$ ] contains the user-supplied tag of the  $k$ th triangle from the first input mesh, for  $k = 1, \dots, \mathbf{nelt1}$ .

9: **nv2** – Integer *Input*

*On entry:* the total number of vertices in the second input mesh.

*Constraint:* **nv2**  $\geq 3$ .

10: **nelt2** – Integer *Input*

*On entry:* the number of triangular elements in the second input mesh.

*Constraint:* **nelt2**  $\leq 2 \times \mathbf{nv2} - 1$ .

11: **nedge2** – Integer *Input*

*On entry:* the number of boundary edges in the second input mesh.

*Constraint:* **nedge2**  $\geq 1$ .

12: **coor2**[ $2 \times \mathbf{nv2}$ ] – const double *Input*

**Note:** where **COOR2**( $i, j$ ) appears in this document it refers to the array element **coor2**[ $2 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

*On entry:* **COOR2**(1,  $i$ ) contains the  $x$ -coordinate of the  $i$ th vertex of the second input mesh, for  $i = 1, \dots, \text{nv2}$ ; while **COOR2**(2,  $i$ ) contains the corresponding  $y$ -coordinate.

13: **edge2**[ $3 \times \text{nedge2}$ ] – const Integer *Input*

**Note:** where **EDGE2**( $i, j$ ) appears in this document it refers to the array element **edge2**[ $3 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

*On entry:* the specification of the boundary edges of the second input mesh. **EDGE2**(1,  $j$ ) and **EDGE2**(2,  $j$ ) contain the vertex numbers of the two end-points of the  $j$ th boundary edge. **EDGE2**(3,  $j$ ) is a user-supplied tag for the  $j$ th boundary edge.

*Constraint:*  $1 \leq \text{EDGE2}(i, j) \leq \text{nv2}$  and **EDGE2**(1,  $j$ )  $\neq$  **EDGE2**(2,  $j$ ) for  $i = 1, 2$  and  $j = 1, 2, \dots, \text{nedge2}$ .

14: **conn2**[ $3 \times \text{nelt2}$ ] – const Integer *Input*

**Note:** where **CONN2**( $i, j$ ) appears in this document it refers to the array element **conn2**[ $3 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

*On entry:* the connectivity between triangles and vertices of the second input mesh. For each triangle  $j$ , **CONN2**( $i, j$ ) gives the indices of its three vertices (in anticlockwise order), for  $i = 1, 2, 3$  and  $j = 1, \dots, \text{nelt2}$ .

*Constraints:*

$1 \leq \text{CONN2}(i, j) \leq \text{nv2}$ ;  
**CONN2**(1,  $j$ )  $\neq$  **CONN2**(2,  $j$ );  
**CONN2**(1,  $j$ )  $\neq$  **CONN2**(3,  $j$ ) and **CONN2**(2,  $j$ )  $\neq$  **CONN2**(3,  $j$ ) for  $i = 1, 2, 3$  and  $j = 1, 2, \dots, \text{nelt2}$ .

15: **reft2**[ $\text{nelt2}$ ] – const Integer *Input*

*On entry:* **reft2**[ $k - 1$ ] contains the user-supplied tag of the  $k$ th triangle from the second input mesh, for  $k = 1, \dots, \text{nelt2}$ .

16: **nv3** – Integer \* *Output*

*On exit:* the total number of vertices in the resulting mesh.

17: **nelt3** – Integer \* *Output*

*On exit:* the number of triangular elements in the resulting mesh.

18: **nedge3** – Integer \* *Output*

*On exit:* the number of boundary edges in the resulting mesh.

19: **coor3**[ $dim$ ] – double *Output*

**Note:** where **COOR3**( $i, j$ ) appears in this document it refers to the array element **coor3**[ $2 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

The dimension,  $dim$ , of the array **coor3** must be at least  $2 \times (\text{nv1} + \text{nv2})$ . This may be reduced to **nv3** once that value is known.

*On exit:* **COOR3**(1,  $i$ ) will contain the  $x$ -coordinate of the  $i$ th vertex of the resulting mesh, for  $i = 1, \dots, \text{nv3}$ ; while **COOR3**(2,  $i$ ) will contain the corresponding  $y$ -coordinate.

20: **edge3**[ $dim$ ] – Integer *Output*

**Note:** where **EDGE3**( $i, j$ ) appears in this document it refers to the array element **edge3**[ $3 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

The dimension,  $dim$ , of the array **edge3** must be at least  $3 \times (\text{nedge1} + \text{nedge2})$ . This may be reduced to **nedge3** once that value is known.

*On exit:* the specification of the boundary edges of the resulting mesh. **EDGE3**( $i, j$ ) will contain the vertex number of the  $i$ th end-point ( $i = 1, 2$ ) of the  $j$ th boundary or interface edge.

If the two meshes overlap, **EDGE3**( $3, j$ ) will contain the same tag as the corresponding edge belonging to the first and/or the second input mesh.

If the two meshes are adjacent,

- (i) if the  $j$ th edge is part of the partition interface, then **EDGE3**( $3, j$ ) will contain the value  $1000 \times k_1 + k_2$  where  $k_1$  and  $k_2$  are the tags for the same edge of the first and the second mesh respectively;
- (ii) otherwise, **EDGE3**( $3, j$ ) will contain the same tag as the corresponding edge belonging to the first and/or the second input mesh.

21: **conn3**[ $dim$ ] – Integer *Output*

**Note:** where **CONN3**( $i, j$ ) appears in this document it refers to the array element **conn3**[ $3 \times (j - 1) + i - 1$ ]. We recommend using a #define to make the same definition in your calling program.

The dimension,  $dim$ , of the array **conn3** must be at least  $3 \times (\text{nelt1} + \text{nelt2})$ . This may be reduced to **nelt3** once that value is known.

*On exit:* the connectivity between triangles and vertices of the resulting mesh. **CONN3**( $i, j$ ) will give the indices of its three vertices (in anticlockwise order), for  $i = 1, 2, 3$  and  $j = 1, \dots, \text{nelt3}$ .

22: **reft3**[ $dim$ ] – Integer *Output*

**Note:** the dimension,  $dim$ , of the array **reft3** must be at least **nelt1** + **nelt2**. This may be reduced to **nelt3** once that value is known.

*On exit:* if the two meshes form a partition, **reft3**[ $k - 1$ ] will contain the same tag as the corresponding triangle belonging to the first or the second input mesh, for  $k = 1, \dots, \text{nelt3}$ . If the two meshes overlap, then **reft3**[ $k - 1$ ] will contain the value  $1000 \times k_1 + k_2$  where  $k_1$  and  $k_2$  are the user-supplied tags for the same triangle of the first and the second mesh respectively, for  $k = 1, \dots, \text{nelt3}$ .

23: **itrace** – Integer *Input*

*On entry:* the level of trace information required from nag\_mesh2d\_join (d06dbc) as follows:

- if **itrace**  $\leq 0$ , no output is generated;
- if **itrace**  $\geq 1$ , then details about the common vertices, edges and triangles to both meshes are printed.

24: **outfile** – char \* *Input*

*On entry:* the name of a file to which diagnostic output will be directed. If **outfile** is NULL the diagnostic output will be directed to standard output.

25: **fail** – NagError \* *Input/Output*

The NAG error parameter (see the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_INT

On entry, **nv1** =  $\langle \text{value} \rangle$ .

Constraint: **nv1**  $\geq 3$ .

On entry, **nedge1** =  $\langle \text{value} \rangle$ .

Constraint: **nedge1**  $\geq 1$ .

On entry, **nv2** =  $\langle \text{value} \rangle$ .

Constraint: **nv2**  $\geq 3$ .

On entry, **nedge2** =  $\langle \text{value} \rangle$ .

Constraint: **nedge2**  $\geq 1$ .

## NE\_INT\_2

On entry, the endpoints of edge  $j$  in the 2nd mesh have the same index  $i$ :  $j = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, vertices 2 and 3 of triangle  $k$  in the 2nd mesh have the same index  $i$ :  $k = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, **nelt1** >  $(2 \times \text{nv1} - 1)$ : **nelt1** =  $\langle \text{value} \rangle$ , **nv1** =  $\langle \text{value} \rangle$ .

On entry, vertices 1 and 3 of triangle  $k$  in the 2nd mesh have the same index  $i$ :  $k = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, vertices 1 and 2 of triangle  $k$  in the 2nd mesh have the same index  $i$ :  $k = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, the endpoints of edge  $j$  in the 1st mesh have the same index  $i$ :  $j = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, vertices 2 and 3 of triangle  $k$  in the 1st mesh have the same index  $i$ :  $k = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, **nelt2** >  $(2 \times \text{nv2} - 1)$ : **nelt2** =  $\langle \text{value} \rangle$ , **nv2** =  $\langle \text{value} \rangle$ .

On entry, vertices 1 and 3 of triangle  $k$  in the 1st mesh have the same index  $i$ :  $k = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

On entry, vertices 1 and 2 of triangle  $k$  in the 1st mesh have the same index  $i$ :  $k = \langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ .

## NE\_INT\_4

On entry, **conn2**( $i, j$ ) < 1 or **conn2**( $i, j$ ) > **nv2**, where **conn2**( $i, j$ ) denotes **conn2**[ $3 \times (j - 1) + i - 1$ ]: **conn2**( $i, j$ ) =  $\langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ ,  $j = \langle \text{value} \rangle$ , **nv2** =  $\langle \text{value} \rangle$ .

On entry, **edge1**( $i, j$ ) < 1 or **edge1**( $i, j$ ) > **nv1**, where **edge1**( $i, j$ ) denotes **edge1**[ $3 \times (j - 1) + i - 1$ ]: **edge1**( $i, j$ ) =  $\langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ ,  $j = \langle \text{value} \rangle$ , **nv1** =  $\langle \text{value} \rangle$ .

On entry, **conn1**( $i, j$ ) < 1 or **conn1**( $i, j$ ) > **nv1**, where **conn1**( $i, j$ ) denotes **conn1**[ $3 \times (j - 1) + i - 1$ ]: **conn1**( $i, j$ ) =  $\langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ ,  $j = \langle \text{value} \rangle$ , **nv1** =  $\langle \text{value} \rangle$ .

On entry, **edge2**( $i, j$ ) < 1 or **edge2**( $i, j$ ) > **nv2**, where **edge2**( $i, j$ ) denotes **edge2**[ $3 \times (j - 1) + i - 1$ ]: **edge2**( $i, j$ ) =  $\langle \text{value} \rangle$ ,  $i = \langle \text{value} \rangle$ ,  $j = \langle \text{value} \rangle$ , **nv2** =  $\langle \text{value} \rangle$ .

## NE\_MESH\_ERROR

The routine has detected a different number of coincident triangles from the two meshes in the overlapping zone  $\langle \text{value} \rangle$   $\langle \text{value} \rangle$ . Check the input of the two meshes, especially the triangles/vertices connectivity.

The routine has detected a different number of coincident edges from the two meshes on the partition interface  $\langle \text{value} \rangle$   $\langle \text{value} \rangle$ . Check the input of the two meshes, especially the edges/vertices connectivity.

The routine has detected only  $\langle \text{value} \rangle$  coincident vertices with a precision **eps** =  $\langle \text{value} \rangle$ . Either **eps** should be changed or the two meshes are not restitchable.

A serious error has occurred in an internal call to the restitching routine. Check the input of the two meshes, especially the edges/vertices and/or the triangles/vertices connectivities. Seek expert help.

**NE\_REAL**

On entry, **eps** =  $\langle value \rangle$ .  
 Constraint: **eps** > 0.0.

**NE\_ALLOC\_FAIL**

Memory allocation failed.

**NE\_BAD\_PARAM**

On entry, parameter  $\langle value \rangle$  had an illegal value.

**NE\_NOT\_WRITE\_FILE**

Cannot open file  $\langle value \rangle$  for writing.

**NE\_NOT\_CLOSE\_FILE**

Cannot close file  $\langle value \rangle$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

## 7 Accuracy

Not applicable.

## 8 Further Comments

`nag_mesh2d_join` (`d06dbc`) finds all the common vertices between the two input meshes using the relative precision of the restitching parameter **eps**. The user is advised to vary the value of **eps** in the neighborhood of 0.001 with **itrace**  $\geq 1$  to get the optimal value for the meshes under consideration.

## 9 Example

For this function two examples are presented. There is a single example program for `nag_mesh2d_join` (`d06dbc`), with a main program and the code to solve the two example problems is given in the functions `ex1` and `ex2` respectively.

```
/* nag_mesh2d_join (d06dbc) Example Program.
 *
 * Copyright 2001 Numerical Algorithms Group.
 *
 * Mark 7, 2001.
 */

#include <stdio.h>
#include <nag.h>
#include <nag_stlib.h>
#include <nagd06.h>

static double fbnd(Integer , double , double , Nag_Comm *);

extern int ex1(void), ex2(void);

#define EDGE1(I,J) edge1[3*((J)-1)+(I)-1]
#define EDGE2(I,J) edge2[3*((J)-1)+(I)-1]
#define EDGE3(I,J) edge3[3*((J)-1)+(I)-1]
#define EDGE4(I,J) edge4[3*((J)-1)+(I)-1]
#define EDGE5(I,J) edge5[3*((J)-1)+(I)-1]
#define CONN1(I,J) conn1[3*((J)-1)+(I)-1]
#define CONN2(I,J) conn2[3*((J)-1)+(I)-1]
```

```

#define CONN3(I,J) conn3[3*((J)-1)+(I)-1]

**Example 1 (ex1)**

This example involves the unit square  $[0, 1]^2$  meshed uniformly, and then translated by a vector  $\vec{u} = \begin{pmatrix} u_1 \\ u_2 \end{pmatrix}$  (using `nag_mesh2d_trans (d06dac)`). This translated mesh is then restitched with the original mesh. Two cases are considered:

- (a) overlapping meshes ( $u_1 = 15.0$ ,  $u_2 = 17.0$ ),
- (b) partitioned meshes ( $u_1 = 19.0$ ,  $u_2 = 0.0$ ).

The mesh on the unit square has 400 vertices, 722 triangles and its boundary has 76 edges. In the overlapping case the resulting geometry is shown in Figure 1 and Figure 2. The resulting geometry for the partitioned meshes is shown in Figure 3.

**Example 2 (ex2)**

This example restitches three geometries by calling the function `nag_mesh2d_join (d06dbc)` twice. The result is a mesh with three partitions. The first geometry is meshed by the Delaunay-Voronoi process (using `nag_mesh2d_delaunay (d06abc)`), the second one meshed by an Advancing Front algorithm (using `nag_mesh2d_front (d06acc)`), while the third one is the result of a rotation (by  $-\pi/2$ ) of the second one (using `nag_mesh2d_trans (d06dac)`). The resulting geometry is shown in Figure 4 and Figure 5.

Example 1
    400      722      :NV1 NELT1
    0.000000E+00  0.000000E+00
    .
    .
    .
    0.100000E+01  0.100000E+01      :COOR1(1:2,1:NV1)
    1          2          22          0
    .
    .
    .
    379      400      399      0  :(CONN1(:,K), REFT, K = 1,...,NELT1)
    'N'                               : Printing option 'Y' or 'N'

```

## 9.3 Program Results

d06dbc Example Program Results

Example 1

```

The restitched mesh characteristics
in the overlapping case
  nv      = 785
  nelt   = 1428
  nedge = 152
in the partition case
  nv      = 780
  nelt   = 1444
  nedge = 133

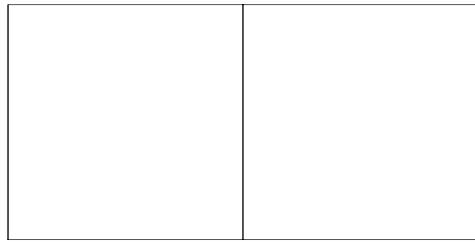

```

Example 2

```

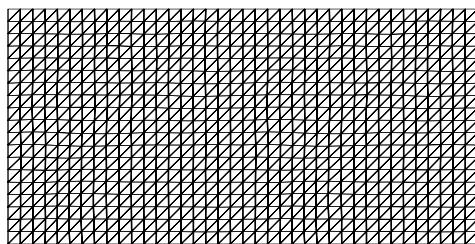

The restitched mesh characteristics
  nv      = 643
  nelt   = 1133
  nedge = 171

```

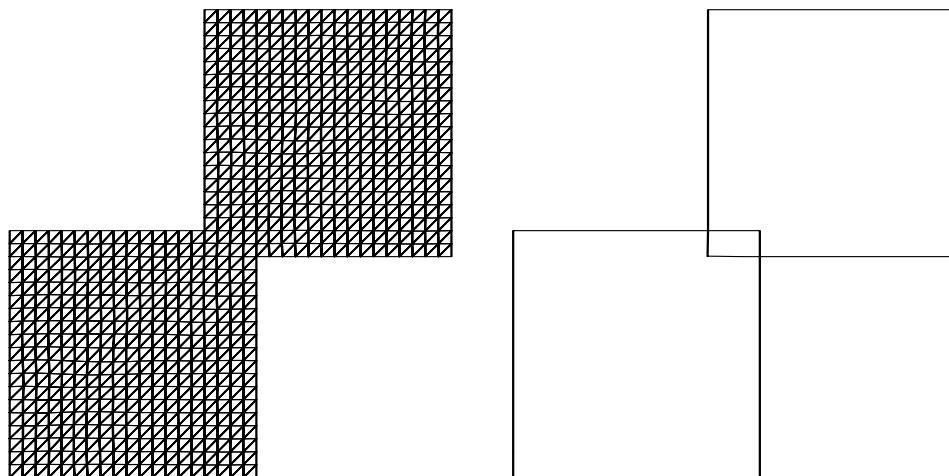

**Figure 1**

The boundary and the interior interfaces of the two partitioned squares geometry

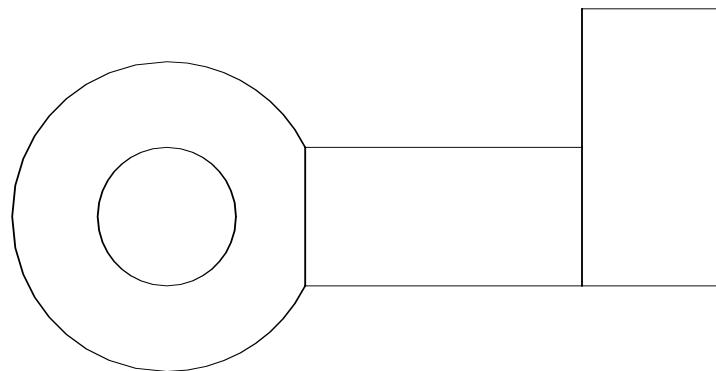

**Figure 2**

The interior mesh of the two partitionned squares geometry

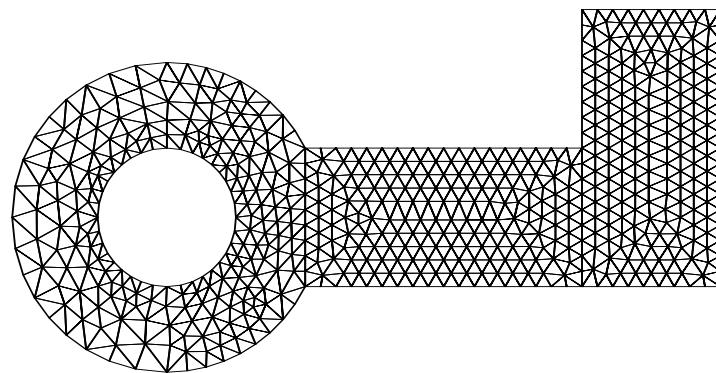

**Figure 3**

The boundary and the interior interfaces (left); the interior mesh (right) of the two overlapping squares geometry
