nag_2d_spline_eval_rect (e02dfc)

1. Purpose

nag_2d_spline_eval_rect (e02dfc) calculates values of a bicubic spline from its B-spline representation. The spline is evaluated at all points on a rectangular grid.

2. Specification

#include <nag.h>
#include <nage02.h>

3. Description

This function calculates values of the bicubic spline s(x, y) on a rectangular grid of points in the x-y plane, from its augmented knot sets $\{\lambda\}$ and $\{\mu\}$ and from the coefficients c_{ij} , for $i = 1, 2, \ldots$, spline.nx-4; $j = 1, 2, \ldots$, spline.ny-4, in its B-spline representation

$$s(x,y) = \sum_{i,j} c_{ij} M_i(x) N_j(y).$$

Here $M_i(x)$ and $N_j(y)$ denote normalised cubic B-splines, the former defined on the knots λ_i to λ_{i+4} and the latter on the knots μ_j to μ_{j+4} .

The points in the grid are defined by co-ordinates x_q , for $q = 1, 2, ..., m_x$, along the x axis, and co-ordinates y_r , for $r = 1, 2, ..., m_y$ along the y axis.

This function may be used to calculate values of a bicubic spline given in the form produced by nag_2d_spline_interpolant (e01dac), nag_2d_spline_fit_grid (e02dcc) and nag_2d_spline_fit_scat (e02ddc). It is derived from the routine B2VRE in Anthony *et al* (1982).

4. Parameters

 $\mathbf{m}\mathbf{x}$

my

Input: **mx** and **my** must specify m_x and m_y respectively, the number of points along the x and y axes that define the rectangular grid.

Constraint: $\mathbf{mx} \ge 1$ and $\mathbf{my} \ge 1$.

x[mx]

y[my]

Input: **x** and **y** must contain x_q , for $q = 1, 2, ..., m_x$, and y_r , for $r = 1, 2, ..., m_y$, respectively. These are the x and y co-ordinates that define the rectangular grid of points at which values of the spline are required.

Constraints: \mathbf{x} and \mathbf{y} must satisfy

$$\label{eq:spline.lamda} \begin{split} \mathbf{spline.lamda}[3] &\leq \mathbf{x}[q-1] < \mathbf{x}[\mathbf{q}] \leq \mathbf{spline.lamda}[\mathbf{spline.nx}-4], \qquad \text{for } q = 1, 2, \dots, m_x - 1, \\ \text{and} \end{split}$$

spline.mu[3] \leq **y**[r-1] < **y**[r] \leq **spline.mu**[**spline.my**-4], for $r = 1, 2, ..., m_y - 1$. The spline representation is not valid outside these intervals.

ff[mx*my]

Output: **ff**[**my** × (q-1) + r - 1] contains the value of the spline at the point (x_q, y_r) , for $q = 1, 2, ..., m_r$; $r = 1, 2, ..., m_u$.

spline

Input: Pointer to structure of type Nag_2dSpline with the following members:

nx - Integer

Input: spline.nx must specify the total number of knots associated with the variable x. It is such that spline.nx-8 is the number of interior knots. Constraint: spline.nx ≥ 8 .

lamda - double *

Input: a pointer to which memory of size **spline.nx** must be allocated. **spline.lamda** must contain the complete sets of knots $\{\lambda\}$ associated with the x variable. Constraint: the knots must be in non-decreasing order, with **spline.lamda**[spline.nx - 4] > **spline.lamda**[3].

ny - Integer

Input: **spline.ny** must specify the total number of knots associated with the variable y. It is such that **spline.ny** - 8 is the number of interior knots. Constraint: **spline.ny** ≥ 8 .

mu - double \ast

Input: a pointer to which memory of size **spline.ny** must be allocated. **spline.mu** must contain the complete sets of knots $\{\mu\}$ associated with the y variable. Constraint: the knots must be in non-decreasing order, with **spline.mu**[**spline.ny** - 4] > **spline.mu**[3].

 ${\bf c}$ - double *

Input: a pointer to which memory of size (spline.nx -4) × (spline.ny -4) must be allocated. spline.c[(spline.ny -4) × (i - 1) + j - 1] must contain the coefficient c_{ij} described in Section 3, for i = 1, 2, ..., spline.nx -4; j = 1, 2, ..., spline.ny -4.

In normal usage, the call to nag_2d_spline_eval_rect follows a call to nag_2d_spline_interpolant (e01dac), nag_2d_spline_fit_grid (e02dcc) or nag_2d_spline_fit_scat (e02ddc), in which case, members of the structure **spline** will have been set up correctly for input to nag_2d_spline_eval_rect.

fail

The NAG error parameter, see the Essential Introduction to the NAG C Library.

5. Error Indications and Warnings

NE_INT_ARG_LT

On entry, **mx** must not be less than 1: $\mathbf{mx} = \langle value \rangle$. On entry, **my** must not be less than 1: $\mathbf{my} = \langle value \rangle$. On entry, **spline.nx** must not be less than 8: **spline.nx** = $\langle value \rangle$. On entry, **spline.ny** must not be less than 8: **spline.ny** = $\langle value \rangle$.

NE_ALLOC_FAIL

Memory allocation failed.

NE_END_KNOTS_CONS

On entry, the end knots must satisfy $\langle value \rangle$, $\langle value \rangle = \langle value \rangle$, $\langle value \rangle = \langle value \rangle$.

NE_NOT_INCREASING

The sequence **spline.lamda** is not increasing: **spline.lamda**[$\langle value \rangle$] = $\langle value \rangle$, **spline.lamda** [$\langle value \rangle$] = $\langle value \rangle$.

The sequence **spline.mu** is not increasing: **spline.mu**[$\langle value \rangle$] = $\langle value \rangle$, **spline.mu**[$\langle value \rangle$] = $\langle value \rangle$.

NE_KNOTS_COORD_CONS

On entry, the end knots and coordinates must satisfy spline.lamda[3] $\leq \mathbf{x}[0]$ and $\mathbf{x}[\mathbf{mx}]-1$] \leq spline.lamda[spline.nx-4]. spline.lamda[3] = $\langle value \rangle$, $\mathbf{x}[0] = \langle value \rangle$, $\mathbf{x}[\langle value \rangle] = \langle value \rangle$, spline.lamda[$\langle value \rangle$] = $\langle value \rangle$.

On entry, the end knots and coordinates must satisfy **spline.mu**[3] \leq **y**[0] and **y**[**my**-1] \leq **spline.mu**[**spline.my**-4]. **spline.mu**[3] = $\langle value \rangle$, **y**[0] = $\langle value \rangle$, **y**[$\langle value \rangle$] = $\langle value \rangle$, **spline.mu**[$\langle value \rangle$] = $\langle value \rangle$.

NE_NOT_STRICTLY_INCREASING

The sequence **x** is not strictly increasing: $\mathbf{x}[\langle value \rangle] = \langle value \rangle$, $\mathbf{x}[\langle value \rangle] = \langle value \rangle$. The sequence **y** is not strictly increasing: $\mathbf{y}[\langle value \rangle] = \langle value \rangle$, $\mathbf{y}[\langle value \rangle] = \langle value \rangle$.

6. Further Comments

Computation time is approximately proportional to $m_x m_y + 4(m_x + m_y)$.

The method used to evaluate the B-splines is numerically stable, in the sense that each computed value of $s(x_r, y_r)$ can be regarded as the value that would have been obtained in exact arithmetic from slightly perturbed B-spline coefficients. See Cox (1978) for details.

8. Example

This program reads in knot sets spline.lamda[0],...,spline.lamda[spline.nx-1]andspline.mu[0],..., spline.mu[spline.ny-1], and a set of bicubic spline coefficients c_{ij} . Following these are values for m_x and the x co-ordinates x_q , for $q = 1, 2, ..., m_x$, and values for m_y and the y co-ordinates y_r , for $r = 1, 2, ..., m_y$, defining the grid of points on which the spline is to be evaluated.
