

NAG C Library Function Document

nag_robust_m_regsn_user_fn (g02hdc)

1 Purpose

nag_robust_m_regsn_user_fn (g02hdc) performs bounded influence regression (M -estimates) using an iterative weighted least-squares algorithm.

2 Specification

```
void nag_robust_m_regsn_user_fn (Nag_OrderType order,
    double (*chi)(double t, Nag_Comm *comm),
    double (*psi)(double t, Nag_Comm *comm),
    double psip0, double beta, Nag_RegType regtype, Nag_SigmaEst sigma_est,
    Integer n, Integer m, double x[], Integer pdx, double y[], double wgt[],
    double theta[], Integer *k, double *sigma, double rs[], double tol, double eps,
    Integer maxit, Integer nitmon, const char *outfile, Integer *nit,
    Nag_Comm *comm, NagError *fail)
```

3 Description

For the linear regression model

$$y = X\theta + \epsilon,$$

where y is a vector of length n of the dependent variable,

X is a n by m matrix of independent variables of column rank k ,

θ is a vector of length m of unknown parameters,

and ϵ is a vector of length n of unknown errors with $\text{var}(\epsilon_i) = \sigma^2$,

nag_robust_m_regsn_user_fn (g02hdc) calculates the M -estimates given by the solution, $\hat{\theta}$, to the equation

$$\sum_{i=1}^n \psi(r_i/(\sigma w_i)) w_i x_{ij} = 0, \quad j = 1, 2, \dots, m, \quad (1)$$

where r_i is the i th residual i.e., the i th element of the vector $r = y - X\hat{\theta}$,

ψ is a suitable weight function,

w_i are suitable weights such as those that can be calculated by using output from nag_robust_m_regsn_wts (g02hbc),

and σ may be estimated at each iteration by the median absolute deviation of the residuals $\hat{\sigma} = \text{med}_i[|r_i|]/\beta_1$

or as the solution to

$$\sum_{i=1}^n \chi(r_i/(\hat{\sigma} w_i)) w_i^2 = (n - k) \beta_2$$

for a suitable weight function χ , where β_1 and β_2 are constants, chosen so that the estimator of σ is asymptotically unbiased if the errors, ϵ_i , have a Normal distribution. Alternatively σ may be held at a constant value.

The above describes the Schweppe type regression. If the w_i are assumed to equal 1 for all i , then Huber type regression is obtained. A third type, due to Mallows, replaces (1) by

$$\sum_{i=1}^n \psi(r_i/\sigma) w_i x_{ij} = 0, \quad j = 1, 2, \dots, m.$$

This may be obtained by use of the transformations

$$\begin{aligned} w_i^* &\leftarrow \sqrt{w_i} \\ y_i^* &\leftarrow y_i \sqrt{w_i} \\ x_{ij}^* &\leftarrow x_{ij} \sqrt{w_i}, \quad j = 1, 2, \dots, m \end{aligned}$$

(see Marazzi (1987b)).

The calculation of the estimates of θ can be formulated as an iterative weighted least-squares problem with a diagonal weight matrix G given by

$$G_{ii} = \begin{cases} \frac{\psi(r_i/(\sigma w_i))}{(r_i/(\sigma w_i))}, & r_i \neq 0 \\ \psi'(0), & r_i = 0. \end{cases}$$

The value of θ at each iteration is given by the weighted least-squares regression of y on X . This is carried out by first transforming the y and X by

$$\begin{aligned} \tilde{y}_i &= y_i \sqrt{G_{ii}} \\ \tilde{x}_{ij} &= x_{ij} \sqrt{G_{ii}}, \quad j = 1, 2, \dots, m \end{aligned}$$

and then using a least squares solver. If X is of full column rank then an orthogonal-triangular (QR) decomposition is used; if not, a singular value decomposition is used.

Observations with zero or negative weights are not included in the solution.

Note: there is no explicit provision in the routine for a constant term in the regression model. However, the addition of a dummy variable whose value is 1.0 for all observations will produce a value of $\hat{\theta}$ corresponding to the usual constant term.

nag_robust_m_regsn_user_fn (g02hdc) is based on routines in ROBETH, see Marazzi (1987b).

5 Parameters

1: **order** – Nag_OrderType *Input*

On entry: the **order** parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order = Nag_RowMajor**. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.

Constraint: **order = Nag_RowMajor** or **Nag_ColMajor**.

2: **chi** *Function*

If **sigma_est = Nag_SigmaChi**, **chi** must return the value of the weight function χ for a given value of its argument. The value of χ must be non-negative.

Its specification is:

```
double chi (double t, Nag_Comm *comm)
```

1: **t** – double

Input

On entry: the argument for which **chi** must be evaluated.

2:	comm – NAG_Comm *	Input/Output
	The NAG communication parameter (see the Essential Introduction).	

chi is required only if **sigma_est** = **Nag_SigmaConst**, otherwise it can be specified as a pointer with 0 value.

3: **psi** Function

psi must return the value of the weight function ψ for a given value of its argument.

Its specification is:

double psi (double t, NAG_Comm *comm)		
1:	t – double	Input
	<i>On entry:</i> the argument for which psi must be evaluated.	
2:	comm – NAG_Comm *	Input/Output
	The NAG communication parameter (see the Essential Introduction).	

4: **psip0** – double Input

On entry: the value of $\psi'(0)$.

5: **beta** – double Input

On entry: if **sigma_est** = **Nag_SigmaRes**, **beta** must specify the value of β_1 .

For Huber and Schweppe type regressions, β_1 is the 75th percentile of the standard Normal distribution (see nag_deviates_normal (g01fac)). For Mallows type regression β_1 is the solution to

$$\frac{1}{n} \sum_{i=1}^n \Phi(\beta_1 / \sqrt{w_i}) = 0.75,$$

where Φ is the standard Normal cumulative distribution function (see nag_cumul_normal (s15abc)).

If **sigma_est** = **Nag_SigmaChi**, **beta** must specify the value of β_2 .

$$\beta_2 = \int_{-\infty}^{\infty} \chi(z) \phi(z) dz, \quad \text{in the Huber case;}$$

$$\beta_2 = \frac{1}{n} \sum_{i=1}^n w_i \int_{-\infty}^{\infty} \chi(z) \phi(z) dz, \quad \text{in the Mallows case;}$$

$$\beta_2 = \frac{1}{n} \sum_{i=1}^n w_i^2 \int_{-\infty}^{\infty} \chi(z/w_i) \phi(z) dz, \quad \text{in the Schweppe case;}$$

where ϕ is the standard normal density, i.e., $\frac{1}{\sqrt{2\pi}} \exp(-\frac{1}{2}x^2)$.

If **sigma_est** = **Nag_SigmaConst**, **beta** is not referenced.

Constraint:

if **sigma_est** $\neq$ **Nag_SigmaConst**, **beta** > 0.0.

6: **regtype** – Nag_RegType Input

On entry: determines the type of regression to be performed.

If **regtype** = **Nag_HuberReg**, Huber type regression.

If **regtype** = **Nag_MallowsReg**, Mallows type regression.

If **regtype** = **Nag_SchweppeReg**, Schweppe type regression.

7: **sigma_est** – Nag_SigmaEst *Input*

On entry: determines how σ is to be estimated.

If **sigma_est** = **Nag_SigmaRes**, σ is estimated by median absolute deviation of residuals.

If **sigma_est** = **Nag_SigmaConst**, σ is held constant at its initial value.

If **sigma_est** = **Nag_SigmaChi**, σ is estimated using the χ function.

8: **n** – Integer *Input*

On entry: the number, n , of observations.

Constraint: $n > 1$.

9: **m** – Integer *Input*

On entry: the number, m , of independent variables.

Constraint: $1 \leq m < n$.

10: **x[dim]** – double *Input/Output*

Note: the dimension, dim , of the array **x** must be at least $\max(1, \mathbf{pdx} \times \mathbf{m})$ when **order** = **Nag_ColMajor** and at least $\max(1, \mathbf{pdx} \times \mathbf{n})$ when **order** = **Nag_RowMajor**.

Where $\mathbf{X}(i, j)$ appears in this document, it refers to the array element

if **order** = **Nag_ColMajor**, $\mathbf{x}[(j-1) \times \mathbf{pdx} + i - 1]$;

if **order** = **Nag_RowMajor**, $\mathbf{x}[(i-1) \times \mathbf{pdx} + j - 1]$.

On entry: the values of the X matrix, i.e., the independent variables. $\mathbf{X}(i, j)$ must contain the ij th element of **x**, for $i = 1, 2, \dots, n$; $j = 1, 2, \dots, m$.

If **regtype** = **Nag_MallowsReg**, then during calculations the elements of **x** will be transformed as described in Section 3. Before exit the inverse transformation will be applied. As a result there may be slight differences between the input **x** and the output **x**.

On exit: unchanged, except as described above.

11: **pdx** – Integer *Input*

On entry: the stride separating matrix row or column elements (depending on the value of **order**) in the array **x**.

Constraints:

if **order** = **Nag_ColMajor**, $\mathbf{pdx} \geq \mathbf{n}$;

if **order** = **Nag_RowMajor**, $\mathbf{pdx} \geq \mathbf{m}$.

12: **y[n]** – double *Input/Output*

On entry: the data values of the dependent variable.

$\mathbf{y}[i-1]$ must contain the value of y for the i th observation, for $i = 1, 2, \dots, n$.

If **regtype** = **Nag_MallowsReg**, then during calculations the elements of **y** will be transformed as described in Section 3. Before exit the inverse transformation will be applied. As a result there may be slight differences between the input **y** and the output **y**.

On exit: unchanged, except as described above.

13: **wgt[n]** – double *Input/Output*

On entry: the weight for the i th observation, for $i = 1, 2, \dots, n$.

If **regtype** = **Nag_MallowsReg**, then during calculations elements of **wgt** will be transformed as described in Section 3. Before exit the inverse transformation will be applied. As a result there may be slight differences between the input **wgt** and the output **wgt**.

If $\mathbf{wgt}[i - 1] \leq 0$, then the i th observation is not included in the analysis.

If **regtype** = **Nag_HuberReg**, **wgt** is not referenced.

On exit: unchanged, except as described above.

- 14: **theta[m]** – double *Input/Output*
On entry: starting values of the parameter vector θ . These may be obtained from least-squares regression. Alternatively if **sigma_est** = **Nag_SigmaRes** and **sigma** = 1 or if **sigma_est** = **Nag_SigmaChi** and **sigma** approximately equals the standard deviation of the dependent variable, y , then **theta**[$i - 1$] = 0.0, for $i = 1, 2, \dots, m$ may provide reasonable starting values.
On exit: the M-estimate of θ_i , for $i = 1, 2, \dots, m$.
- 15: **k** – Integer * *Output*
On exit: the column rank of the matrix X .
- 16: **sigma** – double * *Input/Output*
On entry: a starting value for the estimation of σ . **sigma** should be approximately the standard deviation of the residuals from the model evaluated at the value of θ given by **theta** on entry.
Constraint: **sigma** > 0.0.
On exit: the final estimate of σ if **sigma_est** $\neq$ **Nag_SigmaConst** or the value assigned on entry if **sigma_est** = **Nag_SigmaConst**.
- 17: **rs[n]** – double *Output*
On exit: the residuals from the model evaluated at final value of **theta**, i.e., **rs** contains the vector $(y - X\hat{\theta})$.
- 18: **tol** – double *Input*
On entry: the relative precision for the final estimates. Convergence is assumed when both the relative change in the value of **sigma** and the relative change in the value of each element of **theta** are less than **tol**.
It is advisable for **tol** to be greater than $100 \times \text{machine precision}$.
Constraint: **tol** > 0.0.
- 19: **eps** – double *Input*
On entry: a relative tolerance to be used to determine the rank of X .
If **eps** < *machine precision* or **eps** > 1.0 then *machine precision* will be used in place of **tol**.
A reasonable value for **eps** is 5.0×10^{-6} where this value is possible.
- 20: **maxit** – Integer *Input*
On entry: the maximum number of iterations that should be used during the estimation.
A value of **maxit** = 50 should be adequate for most uses.
Constraint: **maxit** > 0.
- 21: **nitmon** – Integer *Input*
On entry: determines the amount of information that is printed on each iteration.

If **nitmon** ≤ 0 no information is printed.

If **nitmon** > 0 then on the first and every **nitmon** iterations the values of **sigma**, **theta** and the change in **theta** during the iteration are printed.

- 22: **outfile** – char * *Input*
On entry: a null terminated character string giving the name of the file to which results should be printed. If **outfile** = **NULL** or an empty string then the stdout stream is used. Note that the file will be opened in the append mode.
- 23: **nit** – Integer * *Output*
On exit: the number of iterations that were used during the estimation.
- 24: **comm** – NAG_Comm * *Input/Output*
The NAG communication parameter (see the Essential Introduction).
- 25: **fail** – NagError * *Input/Output*
The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** > 1 .

On entry, **pdx** = $\langle value \rangle$.

Constraint: **pdx** > 0 .

On entry, **m** = $\langle value \rangle$.

Constraint: **m** ≥ 1 .

On entry, **maxit** = $\langle value \rangle$.

Constraint: **maxit** > 0 .

NE_INT_2

On entry, **pdx** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pdx** $\geq \mathbf{n}$.

On entry, **pdx** = $\langle value \rangle$, **m** = $\langle value \rangle$.

Constraint: **pdx** $\geq \mathbf{m}$.

On entry, **n** $\leq \mathbf{m}$: **n** = $\langle value \rangle$, **m** = $\langle value \rangle$.

NE_ENUM_INT

On entry, **sigma_est** = $\langle value \rangle$, **beta** = $\langle value \rangle$.

Constraint: if **sigma_est** $\neq$ Nag_SigmaConst, **beta** > 0.0 .

NE_CHI

Value given by **chi** function < 0 : **chi**($\langle value \rangle$) = $\langle value \rangle$.

NE_CONVERGENCE_SOL

Iterations to solve weighted least squares equations failed to converge.

NE_CONVERGENCE_THETA

Iterations to calculate estimates of **theta** failed to converge in **maxit** iterations: **maxit** = $\langle value \rangle$.

NE_FULL_RANK

Weighted least squares equations not of full rank: $\text{rank} = \langle \text{value} \rangle$.

NE_REAL

On entry, **beta** = $\langle \text{value} \rangle$.

Constraint: **beta** > 0.

On entry, **sigma** = $\langle \text{value} \rangle$.

Constraint: **sigma** > 0.

On entry, **tol** = $\langle \text{value} \rangle$.

Constraint: **tol** > 0.

NE_ZERO_DF

Value of $\mathbf{n} - \mathbf{k} \leq 0$: $\mathbf{n} = \langle \text{value} \rangle$, $\mathbf{k} = \langle \text{value} \rangle$.

NE_ZERO_VALUE

Estimated value of **sigma** is zero.

NE_ALLOC_FAIL

Memory allocation failed.

NE_BAD_PARAM

On entry, parameter $\langle \text{value} \rangle$ had an illegal value.

NE_NOT_WRITE_FILE

Cannot open file $\langle \text{value} \rangle$ for writing.

NE_NOT_CLOSE_FILE

Cannot close file $\langle \text{value} \rangle$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

The accuracy of the results is controlled by **tol**.

8 Further Comments

In cases when **sigma_est** $\neq$ **Nag_SigmaConst** it is important for the value of **sigma** to be of a reasonable magnitude. Too small a value may cause too many of the winsorised residuals, i.e., $\psi(r_i/\sigma)$, to be zero, which will lead to convergence problems and may trigger the **fail.code** = **NE_FULL_RANK** error.

By suitable choice of the functions **chi** and **psi** this routine may be used for other applications of iterative weighted least-squares.

For the variance-covariance matrix of θ see `nag_robust_m_regsn_param_var` (g02hfc).

9 Example

Having input X , Y and the weights, a Schweppe type regression is performed using Huber's ψ function. The function `\ttbetcal` calculates the appropriate value of β_2 .
