NAG C Library Function Document

nag_complex_polygamma (s14afc)

1 Purpose

nag_complex_polygamma (s14afc) returns the value of the kth derivative of the psi function $\psi(z)$, for complex z and $k = 0, 1, \ldots, 4$.

2 Specification

```
Complex nag_complex_polygamma(Complex z, Integer k, NagError *fail)
```

3 Description

This routine evaluates an approximation to the kth derivative of the psi function $\psi(z)$ given by

$$\psi^{(k)}(z) = \frac{d^k}{dz^k}\psi(z) = \frac{d^k}{dz^k}\left(\frac{d}{dz}\log_e\Gamma(z)\right),$$

where $z = x + iy$ is complex provided $y \neq 0$ and $k = 0, 1, \ldots, 4$. If $y = 0$, z is real and thus $\psi^{(k)}(z)$ is singular when $z = 0, -1, -2, \ldots$.

Note that $\psi^{(k)}(z)$ is also known as the *polygamma* function. Specifically, $\psi^{(0)}(z)$ is often referred to as the *digamma* function and $\psi^{(1)}(z)$ as the *trigamma* function in the literature. Further details can be found in Abramowitz and Stegun (1972).

nag_complex_polygamma is based on a modification of the method proposed by Kölbig K S (1972).

To obtain the value of $\psi^{(k)}(z)$ when z is real, nag_real_polygamma (s14aec) can be used.

4 Parameters

1: **z** – Complex *Input*

On entry: the argument z of the function.

Constraint: **z**.re must not be 'too close' (see Section 5) to a non-positive integer when **z**.im $= 0.0$.

2: **k** – Integer *Input*

On entry: the function $\psi^{(k)}(z)$ to be evaluated.

Constraint: $0 \leq \mathbf{k} \leq 4$.

3: **fail** – NagError * *Input/Output*

The NAG error parameter (see the Essential Introduction).

5 Error Indicators and Warnings

NE_INT

On entry, **k** = <*value*>.
Constraint: $0 \leq \mathbf{k} \leq 4$.

NE_COMPLEX

On entry, **z** = (<*value*>, <*value*>).
Constraint: **z**.re must not be 'too close' to a non-positive integer when **z**.im $= 0.0$. That is, $|\mathbf{z.re} - \text{nint}(\mathbf{z}.\text{re})| \geq$ ***machine precision*** $\times |\text{nint}(\mathbf{z}.\text{re})|$

NE_OVERFLOW_LIKELY

The evaluation has been abandoned due to the likelihood of overflow. The result is returned as zero.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

6 Further Comments

6.1 Accuracy

Empirical tests have shown that the maximum relative error is a loss of approximately two decimal places of precision.

8 Example

The example program evaluates the psi (trigamma) function $\psi^{(1)}(z)$ at $z = -1.5 + 2.5i$, and prints the results.
