

NAG C Library Function Document

nag_bessel_j_alpha (s18ekc)

1 Purpose

nag_bessel_j_alpha (s18ekc) returns a sequence of values for the Bessel functions $J_{\alpha+n-1}(x)$ or $J_{\alpha-n+1}(x)$ for real x , non-negative $\alpha < 1$ and $n = 1, 2, \dots, |N| + 1$.

2 Specification

```
void nag_bessel_j_alpha (double x, double a, Integer nl, Complex b[],  
                         NagError *fail)
```

3 Description

This routine evaluates a sequence of values for the Bessel function of the first kind $J_\alpha(x)$, where x is real and non-zero and α is the order with $0 \leq \alpha < 1$. The $(|N| + 1)$ -member sequence is generated for orders $\alpha, \alpha + 1, \dots, \alpha + N$ when $N \geq 0$. Note that $+$ is replaced by $-$ when $N < 0$. For positive orders the routine may also be called with $x = 0$, since $J_q(0) = 0$ when $q > 0$. For negative orders the formula

$$J_{-q}(x) = \cos(\pi q)J_q(x) - \sin(\pi q)Y_q(x)$$

is used to generate the required sequence.

4 Parameters

- | | | |
|----|---|---------------------|
| 1: | x – double | <i>Input</i> |
| | <i>On entry</i> : the argument x of the function. | |
| | <i>Constraint</i> : $\mathbf{x} \neq 0.0$ when $\mathbf{nl} < 0$. | |
| 2: | a – double | <i>Input</i> |
| | <i>On entry</i> : the order α of the first member in the required sequence of function values. | |
| | <i>Constraint</i> : $0.0 \leq \mathbf{a} < 1.0$. | |
| 3: | nl – Integer | <i>Input</i> |
| | <i>On entry</i> : the value of N . | |
| | <i>Constraint</i> : $\text{abs}(\mathbf{nl}) \leq 101$. | |
| 4: | b[dim1] – Complex | <i>Output</i> |
| | Note : the dimension, dim1 , of the array b must be at least $\text{abs}(\mathbf{nl}) + 1$. | |
| | <i>On exit</i> : with fail.code = NE_NOERROR or fail.code = NW_SOME_PRECISION_LOSS , the required sequence of function values: b(n) contains $J_{\alpha+n-1}(x)$ if $\mathbf{nl} \geq 0$ and $J_{\alpha-n+1}(x)$ otherwise, for $n = 1, 2, \dots, \text{abs}(\mathbf{nl}) + 1$. | |
| 5: | fail – NagError * | <i>Input/Output</i> |
| | The NAG error parameter (see the Essential Introduction). | |

5 Error Indicators and Warnings

NE_REAL_INT

On entry, $x = <\text{value}>$, $\mathbf{nl} = <\text{value}>$.
 Constraint: $x \neq 0.0$ when $\mathbf{nl} < 0$.

NE_REAL

On entry, $a = <\text{value}>$.
 Constraint: $0.0 \leq a < 1.0$.

NE_INT

On entry, $\mathbf{nl} = <\text{value}>$.
 Constraint: $\text{abs}(\mathbf{nl}) \leq 101$.

NE_OVERFLOW_LIKELY

The evaluation has been abandoned due to the likelihood of overflow.

NW_SOME_PRECISION_LOSS

The evaluation has been completed but some precision has been lost.

NE_TOTAL_PRECISION_LOSS

The evaluation has been abandoned due to total loss of precision.

NE_TERMINATION_FAILURE

The evaluation has been abandoned due to failure to satisfy the termination condition.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

6 Further Comments

6.1 Accuracy

All constants in the underlying functions are specified to approximately 18 digits of precision. If t denotes the number of digits of precision in the floating-point arithmetic being used, then clearly the maximum number of correct digits in the results obtained is limited by $p = \min(t, 18)$. Because of errors in argument reduction when computing elementary functions inside the underlying functions are, the actual number of correct digits is limited, in general, by $p - s$, where $s \approx \max(1, |\log_{10}|x||, |\log_{10}|\alpha||)$ represents the number of digits lost due to the argument reduction. Thus the larger the values of $|x|$ and $|\alpha|$, the less the precision in the result.

8 Example

The example program evaluates $J_0(x)$, $J_1(x)$, $J_2(x)$ and $J_3(x)$ at $x = 0.5$, and prints the results.
