C06FQF – NAG Fortran Library Routine Document

Note. Before using this routine, please read the Users' Note for your implementation to check the interpretation of bold italicised terms and other implementation-dependent details.

1 Purpose

C06FQF computes the discrete Fourier transforms of m Hermitian sequences, each containing n complex data values. This routine is designed to be particularly efficient on vector processors.

2 Specification

```
SUBROUTINE CO6FQF(M, N, X, INIT, TRIG, WORK, IFAIL)INTEGERM, N, IFAILrealX(M*N), TRIG(2*N), WORK(M*N)CHARACTER*1INIT
```

3 Description

Given *m* Hermitian sequences of *n* complex data values z_j^p , for j = 0, 1, ..., n - 1; p = 1, 2, ..., m, this routine simultaneously calculates the Fourier transforms of all the sequences defined by:

$$\hat{x}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j^p \times \exp\left(-i\frac{2\pi jk}{n}\right), \quad k = 0, 1, \dots, n-1; \quad p = 1, 2, \dots, m.$$

(Note the scale factor $\frac{1}{\sqrt{n}}$ in this definition.)

The transformed values are purely real (see also the Chapter Introduction).

The discrete Fourier transform is sometimes defined using a positive sign in the exponential term

$$\hat{x}_k^p = \frac{1}{\sqrt{n}} \sum_{j=0}^{n-1} z_j^p \times \exp\left(+i\frac{2\pi jk}{n}\right).$$

To compute this form, this routine should be preceded by a call to C06GQF to form the complex conjugates of the \hat{z}_{i}^{p} .

The routine uses a variant of the fast Fourier transform (FFT) algorithm (Brigham [1]) known as the Stockham self-sorting algorithm, which is described in Temperton [2]. Special code is included for the factors 2, 3, 4, 5 and 6. This routine is designed to be particularly efficient on vector processors, and it becomes especially fast as m, the number of transforms to be computed in parallel, increases.

5 Parameters

1:	M - INTEGER	Input
	On entry: the number of sequences to be transformed, m .	
	Constraint: $M \ge 1$.	
2:	N — INTEGER	Input
	On entry: the number of data values in each sequence, n .	
	Constraint: $N \ge 1$.	

3: X(M*N) - real array

Input/Output

Input

On entry: the data must be stored in X as if in a two-dimensional array of dimension (1:M,0:N-1); each of the *m* sequences is stored in a **row** of the array in Hermitian form. If the *n* data values z_j^p are written as $x_j^p + iy_j^p$, then for $0 \le j \le n/2$, x_j^p is contained in X(*p*, *j*), and for $1 \le j \le (n-1)/2$, y_j^p is contained in X(*p*, *n* - *j*). (See also Section 2.1.2 of the Chapter Introduction.)

On exit: the components of the *m* discrete Fourier transforms, stored as if in a two-dimensional array of dimension (1:M,0:N-1). Each of the *m* transforms is stored as a **row** of the array, overwriting the corresponding original sequence. If the *n* components of the discrete Fourier transform are denoted by \hat{x}_k^p , for $k = 0, 1, \ldots, n-1$, then the *mn* elements of the array X contain the values

$$\hat{x}_0^1, \hat{x}_0^2, \dots, \hat{x}_0^m, \ \hat{x}_1^1, \hat{x}_1^2, \dots, \ \hat{x}_1^m, \dots, \ \hat{x}_{n-1}^1, \hat{x}_{n-1}^2, \dots, \hat{x}_{n-1}^m.$$

4: INIT — CHARACTER*1

On entry: if the trigonometric coefficients required to compute the transforms are to be calculated by the routine and stored in the array TRIG, then INIT must be set equal to 'I' (Initial call).

If INIT contains 'S' (Subsequent call), then the routine assumes that trigonometric coefficients for the specified value of n are supplied in the array TRIG, having been calculated in a previous call to one of C06FPF, C06FQF or C06FRF.

If INIT contains 'R' (**R**estart), then the routine assumes that trigonometric coefficients for the particular value of N are supplied in the array TRIG, but does not check that C06FPF, C06FQF or C06FRF have previously been called. This option allows the TRIG array to be stored in an external file, read in and re-used without the need for a call with INIT equal to 'I'. The routine carries out a simple test to check that the current value of n is compatible with the array TRIG.

Constraint: INIT = I', 'S' or 'R'.

5: TRIG(2*N) - real array

On entry: if INIT = S' or 'R, TRIG must contain the required coefficients calculated in a previous call of the routine. Otherwise TRIG need not be set.

On exit: TRIG contains the required coefficients (computed by the routine if INIT = 'I').

- 6: WORK(M*N) real array
- **7:** IFAIL INTEGER

On entry: IFAIL must be set to 0, -1 or 1. For users not familiar with this parameter (described in Chapter P01) the recommended value is 0.

On exit: IFAIL = 0 unless the routine detects an error (see Section 6).

6 Error Indicators and Warnings

If on entry IFAIL = 0 or -1, explanatory error messages are output on the current error message unit (as defined by X04AAF).

Errors detected by the routine:

IFAIL = 1

On entry, M < 1.

IFAIL = 2

On entry, N < 1.

IFAIL = 3

On entry, INIT is not one of 'I', 'S' or 'R'.

Workspace

Input/Output

Input/Output

IFAIL = 4

Not used at this Mark.

IFAIL = 5

On entry, INIT = S' or R', but the array TRIG and the current value of n are inconsistent.

IFAIL = 6

An unexpected error has occurred in an internal call. Check all subroutine calls and array dimensions. Seek expert help.

7 Accuracy

Some indication of accuracy can be obtained by performing a subsequent inverse transform and comparing the results with the original sequence (in exact arithmetic they would be identical).

8 Further Comments

The time taken by the routine is approximately proportional to $nm \times \log n$, but also depends on the factors of n. The routine is fastest if the only prime factors of n are 2, 3 and 5, and is particularly slow if n is a large prime, or has large prime factors.

9 Example

This program reads in sequences of real data values which are assumed to be Hermitian sequences of complex data stored in Hermitian form. The sequences are expanded into full complex form using C06GSF and printed. The discrete Fourier transforms are then computed (using C06FQF) and printed out. Inverse transforms are then calculated by calling C06FPF followed by C06GQF showing that the original sequences are restored.

9.1 Program Text

Note. The listing of the example program presented below uses bold italicised terms to denote precision-dependent details. Please read the Users' Note for your implementation to check the interpretation of these terms. As explained in the Essential Introduction to this manual, the results produced may not be identical for all implementations.
